PROJECT LIMITATIONS

Limitations of the Project

Although the project provides useful insights into job market trends and required skills, it has some limitations that may affect the accuracy and completeness of the analysis.

1. Missing Salary Data

The dataset does not contain sufficient salary information for the job roles. Therefore, the project cannot provide a detailed salary comparison or identify salary trends across different job positions.

2. Limited Job Categories

The project mainly focuses on Data Science-related job roles. Other important fields, such as Web Development, Software Engineering, Cybersecurity, and Cloud Computing, are not covered. This limits the overall understanding of the job market.

3. Single Data Source

The analysis is based on a single data source. Using only one source may limit the reliability and diversity of the information. Different platforms may provide different job market trends and requirements.

4. Limited Dataset Coverage

The analysis depends on the available dataset. If the dataset does not include enough job listings or updated information, the results may not represent the complete job market.

Conclusion

These limitations highlight areas where the project can be improved in the future. Adding salary information, including more job categories, and collecting data from multiple sources can make the analysis more accurate, reliable, and comprehensive.
